

# Wanted!

Entrepreneurial Hiveware® C++ Developers

with

Group-Authoring Ideas

Hiveware is a for-remuneration transformational technology. It allows groups of information contributors to cooperate in producing a joint informational work and it allows them to be entrepreneurial about its use.

Take advantage of Hiveware, the new distributed development environment, which changes both the way users interact but also the way developers work together to develop long-running distributed applications. We want you to use our SDCDC® development platform to bring your multiple simultaneous user-driven idea to life. SDCDC stands for Synchronous Distributed Context Distributed Content.

Qualifications include C++ development experience with a demonstrated desire to develop applications. Applicants with cross-disciplinary educational and experience backgrounds are preferred. These skills must be complemented with a desire to take your own social networking idea and deliver it as an application for commercial profit.

If you feel that you fit that description, please contact us so we can discuss your idea and how the Hiveware platform could make you succeed in your venture. If you are accepted, you will receive an ownership contract for your own Hiveware domain and software with which you can realize your idea.
